

Magnesium · Soleil · Project

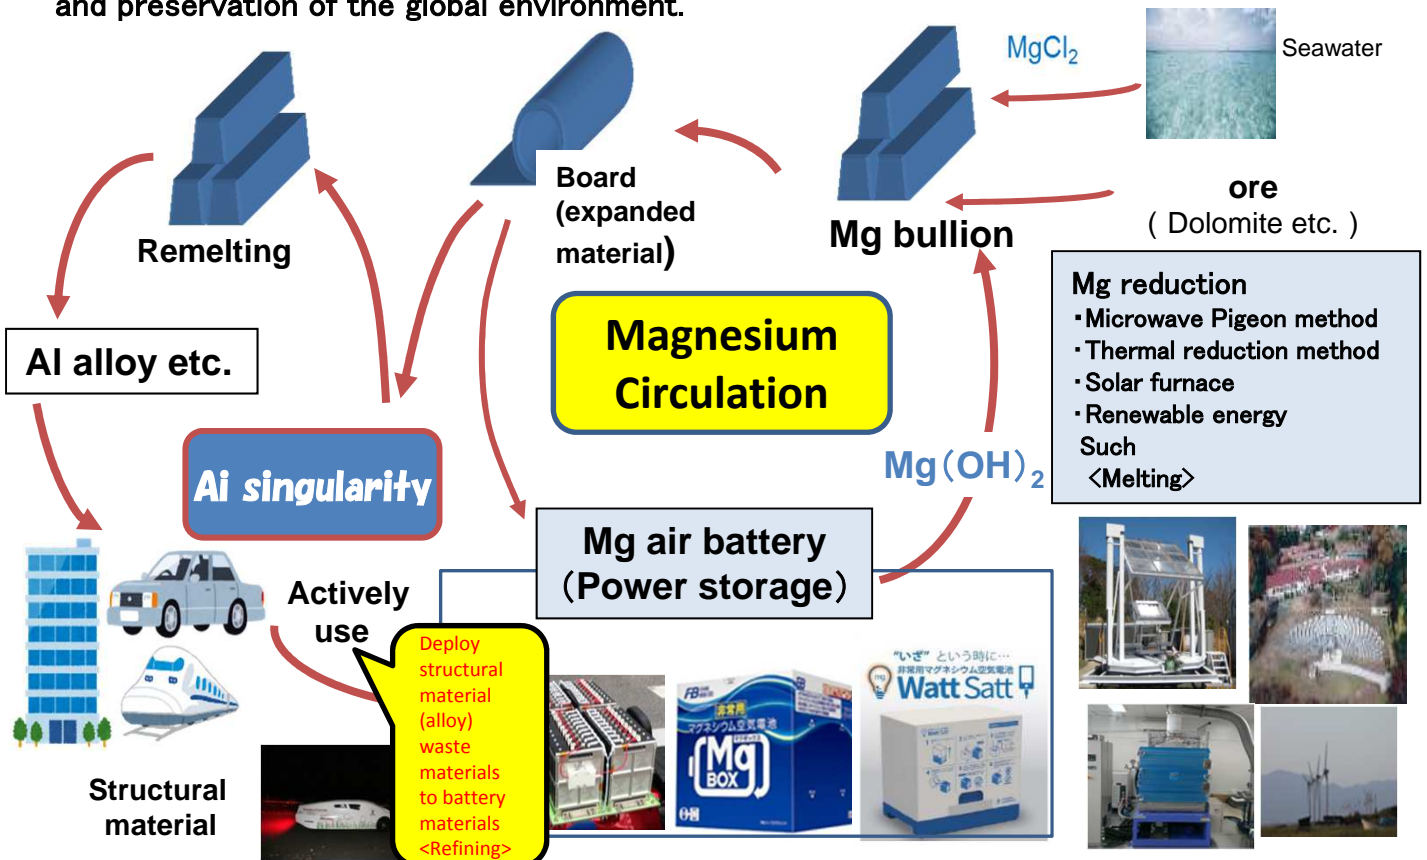

We aim to build a recycling society using Mg (magnesium) as energy!

【The Purpose】

2017.11.

The biggest challenge the Earth faces in the 21st century is to create and consume sustainable energy. As a method, it is possible to more effectively use magnesium, alloy, melting of structural materials and building materials, development of batteries using waste materials, recycling using natural energy and surplus energy effectively.

Promote magnesium energy education activities including magnesium air batteries as next generation energy and realize construction as a fair theme that can be treated as a fair theme not only in Japan but also anywhere in the world. We will contribute to maintenance and preservation of the global environment.
